Anatomical Evidence Of Evolution Lab LAB ____ . ANATOMICAL EVIDENCE OF EVOLUTION In our studies of the anatomy and development of animals we have discovered that many living creatures that look quite different on the surface have similarities underneath their skin that suggest that they are related to each other. This is evidence that living creatures have evolved, Evidence of Evolution2008 Each part of this lab will explore one of the major sources of evidence that support the theory of evolution. PART A: The Fossil Record and the Age of the Earth Fossils are the remains of long-dead organisms that have escaped decay and become part of

the Earth's crust. Thus, fossils are evidence of organisms that lived long ago. Evidences for Evolution Lab The main way scientists have supported the Theory of Evolution throughout history is by using anatomical similarities between organisms. Showing how body parts of one species resemble the body parts of another species, as well as accumulating adaptations until structures become more similar on unrelated species are some ways evolution is backed up by anatomical evidence. Answers The study of fossils as well as work in embryology,

biochemistry and comparative anatomy provides evidence for

evolution. Objective In this lab you

will learn about homologous, analogous and vestigial structures and their significance in evolution theory. TAKS Obj 7A: The student knows the theory of biological evolution. The student is expected to identify evidence of change in species using fossils, DNA sequences, anatomical similarities, physiological similarities, and embryology. evolutional evidence lab | Homology (Biology) | Evolution 16) biochemistry is considered the best evidence for evolution. An important protein in animals called cytochrome c is used during cellular respiration. There are fewer differences in the amino acid sequence of this protein between more closely related species. Livingston Public Schools / LPS Homepage The vestigial

tailbone in humans is homologous to the functional tail of other primates. Thus vestigial structures can be viewed as evidence for evolution: organisms having vestigial structures probably share a common ancestry with organisms in which the homologous structure is functional. Evidence of Evolution-Answers in gray Background Fossils Multiple types of evidence support the theory of evolution: Homologous structures provide evidence for common ancestry, while analogous structures show that similar selective pressures can produce similar adaptations (beneficial features). Evidence for evolution (article) | Khan Academy Evidence of Evolution A lab that explores homologous,

analogous and vestigial organs. Evolutionary Relationships (aka the State's Biodiversity Lab) An alternative adaptation of the State's Biodiversity lab. The student is expected to identify evidence of change in species using fossils, DNA sequences, anatomical similarities, physiological similarities, and embryology. Evidence of Evolution - St. Francis Preparatory School Scientists compare the anatomy, embryos, and DNA of living things to understand how they evolved. Evidence for evolution is provided by homologous structures. These are structures shared by related

organisms that were inherited from a common ancestor. Other evidence is provided by analogous structures. 9.3: Evidence for Evolution - Biology

Evolution Lab Essay - 767 Words Evidence from Comparative Anatomy In the study of evolutionary relationships, parts of organisms are said to be homologous if they exhibit similar basic structures and embryonic origins. If parts of organisms are similar in function only, They are

said to be analogous. Lab Chapter 13: Evidence of Evolution
