Carbonic Anhydrase Its Inhibitors And Acetazolamide, dichlorphenamide, and methazolamide are carbonic anhydrase inhibitors. Carbonic anhydrase inhibitors also decrease the secretion of aqueous humor (the aqueous humor is the clear fluid that fills the space between the lens and the cornea of the eyeball), which results in a decrease in intraocular pressure. Carbonic anhydrase inhibitors are IOP-lowering sulfonamide derivatives which inhibit the activity of CA in the ciliary processes of the

eye, thus reducing aqueous humor formation and consequently decreasing IOP. Systemic CAIs provide an approximately 40% IOP reduction, and their effect develops rapidly. Carbonic Anhydrase Inhibitors - an overview

... Acetazolamide is a carbonic anhydrase inhibitor that causes CO<sub>2</sub> to accumulate within the brain, blocking anion transport and increasing  $\gamma$ -aminobutyric acid (GABA) levels, leading to a modulation of firing rate (Wyllie et al., 2010). It is also used as an antiepileptic. Carbonic Anhydrase Inhibitor - an overview |

glaucoma, the excessive build up of water in the eyes. Blocking this enzyme shifts the fluid balance in the eyes of the patient to reduce fluid build up thereby relieving pressure. The Bohr Effect is a way to describe hemoglobin's oxygen binding affinity. Carbonic anhydrase - Wikipedia Native mass spectrometry is a potent technique to study and characterize biomacromolecules in their native state. Here, we have applied this method to explore the solution chemistry of human carbonic anhydrase I (hCA I) and its interactions with four different inhibitors, namely three sulfonamide inhibitors (AAZ, MZA, SLC-0111) and the dithiocarbamate derivative of morpholine (DTC).
